

# COMMUNITY WARNING

These products look like vitamins or candy, but they can affect the brain the same way strong prescription pain medicine does — and they're being sold next to snacks and energy drinks where teens shop.

Parents in our area have reported teens getting sick from products they thought were harmless. You deserve to know what's being sold here.

## WHAT IS 7-OH?

7-OH is a compound the body makes after using kratom. It can create strong painkiller-like effects — causing drowsiness, confusion, and sometimes dependence.

## WHY IT'S A CONCERN

- Creates effects similar to strong prescription pain medicine.
- Packaging is bright and harmless-looking, so teens underestimate

danger.

- Strength varies — labels may not match what's inside.

## SIGNS YOUR TEEN MAY BE USING IT

- Very small pupils.
- Sudden sleepiness or trouble staying awake.
- Shaking, sweating, irritability.
- Hidden packets labeled 'kratom,' 'Maeng Da,' or energy/relax tablets.

## WHAT YOU CAN DO

- Check local stores — these are often placed near candy & vapes.
- Look in backpacks, glove compartments, drawers, and trash bins.
- Start a calm conversation: "These look harmless, but they can act like strong pain medicine. I just want you safe."

**Emergency:** Difficulty staying awake or slowed breathing → Call **911**.

Poison Control: **1-800-222-1222**
