

COMMUNITY WARNING: TIANEPTINE ('GAS-STATION HEROIN')

Tianeptine products like Neptune's Fix and ZaZa are being sold in gas stations and vape shops. They look like harmless drinks or supplements, but they can affect the brain the same way very strong pain medicines do. These products are linked to addiction, overdose, and ER visits.

Parents across the U.S. report teens experiencing extreme drowsiness, agitation, confusion, and withdrawal after using these products.

WHAT IS TIANEPTINE?

Tianeptine is a synthetic chemical sometimes misleadingly marketed as an antidepressant or 'mood booster.' In higher amounts, it can act like a powerful pain-relieving drug, causing sedation and dependence.

WHY IT'S DANGEROUS

- Products like Neptune's Fix and ZaZa are linked to poison center calls and ER visits.
- Can cause slowed breathing, extreme drowsiness, or dangerous withdrawal.
- Packaging looks fruity and harmless—teens underestimate the risk.

SIGNS SOMEONE MAY BE USING TIANEPTINE

- Extreme sleepiness or trouble staying awake.
- Sudden mood swings, confusion, or agitation.
- Shaking, sweating, stomach pain.
- Small bottles labeled Neptune's Fix, ZaZa, Tianna, or 'Elixir.'

WHAT PARENTS CAN DO

- Check stores your teen visits—these bottles are often near energy shots or vapes.
- Look in backpacks, cars, bathrooms, and trash bins.

- Have a calm talk: "These look harmless, but they can affect your brain like very strong pain medicine. I want you safe."

Emergency: Trouble waking up or slowed breathing → Call **911**.

Poison Control: **1-800-222-1222**
