

BLUE LOTUS PRODUCTS FOUND IN SCHOOLS

School Resource Officer Rapid Visual Guide

MothersAgainstHerbalAbuse.org

What These Products Are

Blue lotus (*Nymphaea caerulea*) is sold as gummies, vapes, teas, chocolates, tinctures, and powders. It is not FDA-approved for human consumption and products sold as supplements are considered adulterated.

Psychoactive Effects and Risks

Contains aporphine and nuciferine, acting on dopamine and serotonin receptors. Effects include sedation, disorientation, visual distortions, impaired coordination, blackouts, and possible respiratory depression.

Interaction Risks

Dangerous interactions with alcohol, opioids, benzodiazepines, SSRIs, ADHD meds, kratom, and other sedatives. Combined use increases risk of slowed breathing and unconsciousness.

Documented Medical Events

Reports include seizures, panic attacks, hallucinations, psychosis, agitation, vomiting, confusion, and dangerous heart rhythms.

Why SROs Should Be Alert

- Marketed as a 'natural high' despite strong psychoactive effects
- Bright packaging appeals to youth
- Easy to hide in backpacks and lockers
- Does not appear on basic urine drug screens
- Gummies and vapes cause fast impairment

SRO Response Guidance

- Confiscate and notify administration
- Photograph packaging and document statements
- Send to nurse if showing sedation, confusion, vomiting, or slowed breathing
- Secure packaging in evidence envelope
- Notify liaison if distribution is suspected
