

KANNA PRODUCTS FOUND IN SCHOOLS

School Resource Officer Visual Identification Brief

MothersAgainstHerbalAbuse.org

What These Products Are

Kanna (*Sceletium tortuosum*) is sold as gummies, chews, tinctures, capsules, shots, and vapes. It is marketed as a 'natural mood booster' but has psychoactive properties and is not FDA-approved.

Psychoactive Effects and Risks

Kanna affects serotonin pathways. Effects can include euphoria, emotional numbness, dizziness, nausea, tremors, agitation, or sedation. High-potency extracts increase risk of adverse reactions and impaired coordination.

Interaction Risks

Kanna can interact dangerously with SSRIs, SNRIs, MAOIs, ADHD meds, kratom, alcohol, and stimulants. Mixing kanna with serotonergic medications increases risk of serotonin overload and unpredictable neuropsychiatric reactions.

Teen Appeal and Packaging

- Bright, cartoon-like packaging
- Sold as 'legal highs' in vape shops
- Easy to hide in backpacks, lockers, and gym bags
- Often combined with kava, caffeine, or THC analogs
- Highly variable potency; gummies and chews may differ 10x in strength

Documented Issues

Cases report agitation, vomiting, tachycardia, confusion, tremors, panic episodes, and adverse reactions after mixing products.

SRO Response Guidance

- Confiscate and notify administration
- Photograph packaging and document statements
- Send to nurse if showing dizziness, nausea, confusion, agitation, or tremors
- Place packaging in evidence envelope if impairment suspected
- Notify law enforcement liaison if distribution is suspected
